Date	7 September 2026	Day	Day 3
Company	MySoft Heaven BD	Session	Project Selection & Presentation
Supervised By			
Imdadul Haque		Sr. Software Engineer	
M. H. A. Afif		IT Business Analyst	

1. Project Selection

On the third day of our industrial attachment, our team finalized the project we wanted to work on. After reviewing the available project ideas and discussing their implementation and future scope, we selected **Enterprise AI Anomaly Detection & Financial Risk Platform** as our project.

2. Background Study and Literature Review

After selecting the project, we presented our initial background study and literature review. We reviewed existing approaches related to fraud monitoring, anomaly detection, and financial risk assessment. This study helped us understand the existing work in this area and identify the limitations that our proposed system could address.

3. Project Presentation

We gave a short presentation to our supervisors explaining our selected project, its background, the research gap we identified, and our initial implementation plan. We also discussed how the proposed

platform could be applied to Bangladesh-oriented Mobile Financial Services (MFS) to identify suspicious transactions and assess financial risks.

4. The Challenge: Detecting Modern Financial Fraud

We identified that the rapid growth of digital financial services has made fraud detection more complex. Traditional fraud detection systems may struggle to identify new and evolving fraud patterns. Increasing transaction volume, unknown or zero-day fraud activities, false positives affecting genuine customers, false negatives causing financial losses, and limited transparency in fraud detection decisions were discussed as important industry challenges.

5. Current Gap and Proposed Need

From our initial study, we identified a gap in existing rule-based and traditional machine learning systems, which mainly focus on known fraud patterns and may provide limited adaptive and explainable risk assessment. Based on this gap, we identified the need for a hybrid AI-based solution that can detect anomalies, analyze transaction behavior, and provide explainable financial risk decisions.

6. Project Goal and Objectives

The main goal of our project is to develop an AI-powered financial risk monitoring platform for detecting fraudulent and abnormal transaction activities in Bangladesh-oriented Mobile Financial Services (MFS). Our specific objectives are to detect known fraud patterns using machine learning models, identify unknown suspicious activities through anomaly detection, analyze customer transaction behavior for deviations, generate risk scores for financial transactions, and provide explainable AI insights behind fraud predictions.

7. Overall Reflection

Day 3 was an important step in defining the direction of our industrial attachment project. By completing the project selection, reviewing relevant background information, identifying the research gap, and presenting our initial idea, we developed a clearer understanding of what we want to build and why it is needed. The feedback and discussion with our supervisors also helped us prepare for the next stage of implementation.
