Date	10 September 2026	Day	Day 6
Company	MySoft Heaven BD	Session	Initial Frontend Development
Supervised By			
Imdadul Haque		Sr. Software Engineer	
M. H. A. Afif		IT Business Analyst	

1. Frontend Development Started

On Day 6, we moved further into the actual development of our Enterprise AI Anomaly Detection & Financial Risk Platform. We started designing and implementing the frontend of the system using Next.js and the existing project setup. The main focus was to create the pages and interfaces that an administrator would use to monitor the financial risk system.

2. Home Page, Login and Authentication

We implemented the initial home page and started developing the admin-side access flow. A login page was created for the administrator, along with authentication functionality. This provided the basic access control required before an administrator can enter and use the monitoring dashboard.

3. Admin Dashboard

We developed the main dashboard where an administrator can get an overall view of the monitoring system. The dashboard was designed to provide a central place for monitoring important information and accessing the major functions of the platform.

4. Transactions Page and Filtering

A major part of the day's work was the Transactions page. We implemented functionality that allows the administrator to view transaction information and access customer details associated with individual transactions. We also added filtering options so that transactions can be searched and reviewed by user ID, name, risk level, transaction type, and different time periods such as the last 7, 30, and 90 days.

5. Transaction Behaviour Monitoring

We added a transaction-level view where the administrator can examine a user's transaction behaviour through a graphical representation. This allows transaction activity and behavioural patterns to be viewed more clearly instead of relying only on raw transaction records.

6. Account Risk Summary and Admin Actions

We also implemented an account risk summary to provide an overview of a customer's risk-related information. Administrative actions were added to support transaction monitoring, including the ability to block a transaction and mark a transaction for escalation when further attention is required.

7. Backend Route Setup

Alongside the frontend work, we continued developing the backend structure by creating the required route paths. These routes provide the basic API structure needed for communication between the frontend, backend services, transaction data, and the future AI/ML components.

8. Overall Reflection

Day 6 was focused on turning the project concept into a more functional web application. By implementing authentication, the admin dashboard, transaction filtering, behavioural graphs, risk summaries, administrative actions, and backend routes, we established important parts of the platform's user interface and application structure. This work created a stronger foundation for connecting the monitoring interface with the backend and AI/ML system in the following stages.
