Date	13 September 2026	Day	Day 7
Company	MySoft Heaven BD	Session	Project Progress Review & Supervisor Feedback
Supervised By			
Imdadul Haque		Sr. Software Engineer	
M. H. A. Afif		IT Business Analyst	

1. Project Progress Presentation

On Day 7, we presented the current progress of our AnomalyX project to our supervisors, Imdadul Haque, Sr. Software Engineer, and M. H. A. Afif, IT Business Analyst. We showed the work completed so far and explained the current progress of both the machine learning model and the frontend application. The main purpose of the session was to receive feedback from our supervisors and identify the areas that required further improvement before continuing with the next stage of development.

2. Discussion with the Supervisors

During the project review, our supervisors discussed the progress of our work and provided several suggestions and modifications. They reviewed the current implementation and pointed out areas where further improvement would be useful. The discussion gave us a clearer understanding of the parts that needed more attention and helped us plan the next steps of the project based on practical feedback from our supervisors.

3. Model Performance Review

One of the main topics discussed during the session was the performance of our machine learning model. We explained that the model was achieving good accuracy. However, our supervisors pointed out that the recall and F1-score were comparatively poor. They explained that accuracy alone was not enough to judge

the performance of our fraud detection model, because the system also needs to identify fraudulent or anomalous cases effectively. This showed us that the model required further improvement even though its accuracy was good.

4. Suggestions for Model Improvement

To improve the model performance, our supervisors suggested that we investigate some important parameters of the model and experiment with changing their values. They advised us to identify which parameters could have a positive effect on recall and F1-score while maintaining a reasonable accuracy level. We were therefore given a clear direction to perform further experiments, compare the results of different parameter settings, and find a more suitable configuration for the model.

5. Frontend Progress Presentation

We also demonstrated the progress of our frontend application during the session. We showed the features that had already been implemented and explained how the frontend would support the financial risk monitoring platform. Our supervisors reviewed the current interface and suggested adding some additional features and making certain modifications. Their feedback will help us improve the functionality of the application and make the frontend more suitable for the requirements of our project.

6. Learning from the Feedback

The Day 7 review helped us understand that a machine learning model should be evaluated using several performance measures instead of depending only on accuracy. We learned that good accuracy can still be accompanied by poor recall and F1-score, which is an important issue for a fraud detection system. We also understood that frontend development should be continuously reviewed and improved according to the system requirements and the feedback received during project discussions.

7. Overall Reflection and Next Steps

Overall, Day 7 was an important progress-review session for our team. We presented the current condition of both the model and frontend and received specific suggestions for further development. Our next steps are to investigate the important model parameters and conduct experiments to improve recall and F1-score. At the same time, we will work on the additional frontend features and modifications suggested by our supervisors. The feedback from this session gave us a clearer direction for the next stage of AnomalyX development.
